

## HTML Forms

The HTML `<form>` element defines a form that is used to collect user input. Form elements (tags) define different types of inputs, like textboxes, checkboxes, radio buttons and submit/reset buttons.

For this lesson, our goal is to learn how to create a form and use all of the elements mentioned above.

1. Start by browsing to [www.w3schools.com/html/html\\_forms.asp](http://www.w3schools.com/html/html_forms.asp) to read about how to use each element. Make sure to use the next button to read about each of the topics for this lesson (Elements, Types and Attributes). For now, we will not yet learn about how to submit information to the form. This will be covered in future lessons. You can omit reading about the Action and Method attribute for `<form>`.
2. Design the form shown below in a file called **regForm.html**. Try to layout the visual elements using multiple tables. The “Comments?” input element is a `<textarea>` for the submit and reset buttons, you can use the following code:

```
<input type="submit" value="Click to Register">  
<input type="reset" value="Click to Cancel">
```
